Installing a Patch Panel

Definition: a Patch Panel is found in a local area network LAN and is a mounted hardware assembly that contains ports that are used to connect and manage incoming and outgoing LAN cables. Patch Panel provides a way for us to keep large numbers of cables organized, enabling flexible connectivity into network hardware located in a data center or an access **or wiring closet.**

Function of a Patch Panel

Centralized Organization: Patch panel serves as a hub or central point where incoming and outgoing cables from network devices, switches, routers or servers terminate.

Simplifies connectivity: Administrators simply move the patch cables to a new port.

Troubleshooting and maintenance: Patch Panels make it easier to diagnose network issues.
