

Practical Week 1

Network Infrastructure

Thulo Madiehe

1

Cable Tester Here's a structured guide to help you identify networking tools, explain their uses, and apply safe working procedures. I've broken it down step by step so it's easy to follow and practical for your coursework or lab activities.

Punch down tool terminates wires into patch panels or keystone jacks

RJ45 connectors are used for Ethernet cables

Understand the purpose of each tool in networking tasks.

2

Crimping tool helps secures RJ45 connectors to cables

Cable tester helps make sure that the cables are wired correctly

Punch-down tool helps organizes wiring in structured cabling

RJ45 connectors help to enable physical connections

Analyzer software assists diagnoses network issue

3

Used to insert wires into patch panels or keystone jacks.

Apply gentle pressure to avoid wire damage and wear safety glasses

Cable Tester

Hazard

Checks continuity and wiring of network cables. Never connect to live wires

Handle cables carefully to prevent damage

Screwdrivers

Best Practice

Used for assembling and securing networking equipment.

Use the correct size to avoid slipping

Replace broken screwdrivers immediately

5

Always check the instructions provided with each tool or device before use.

Spot possible risks

Watch out for hazards such as:

Cables lying loose on the floor

Sharp-edged tools

Electrical equipment in close proximity

Wear suitable protective gear

Depending on the task, use Goggles to protect your eyes wear gloves for hand safety and safety boots to protect your feet A dust mask if particles are present

Maintain a tidy workspace keep your area clean and organized to reduce accidents and improve efficiency.

Check equipment condition

Never use damaged or faulty tools replace or repair them before continuing
